

The SageRider **CT Perforating System**<sup>™</sup> is a perforating system designed to provide a reliable method of initiating multiple intervals on coiled tubing with a single run in the wellbore. Initially designed as a solution for perforating toe sections in cased hole horizontal wells, the **CT Perforating System**<sup>™</sup> now provides added safety when using a single trip into any wellbores that have open perms, sliding sleeve problems, squeeze perms, or open shoes.

- Run multiple casing guns on a single trip in vertical or horizontal wells with less lubricator section requirements
- Compatible with all types of explosives and charge types
- Fewer firing heads for increased reliability
- Custom initiation configurations utilizing delays, direct pressure, by-pass actuation, or any combination needed
- Varying delay intervals available
- Cost effective solution when compared to conventional methods
- Time savings due to fewer interventions and time required for procedures between separately initiated systems
