

The **Pony Express™** Pump Down Initiator provides a safe reliable method of perforating the casing at the toe of a cemented horizontal wellbore. Placed as the last step of the cementing process, the **Pony Express™** system can eliminate the cost of traditional conveyance methods or wellbore modifications to provide a solution for initiating a pump down flow path. Once established, this flow path can then be utilized for pumping down perforating guns or any tool assembly desired.

- Optimum safety through 3-gate firing system
- System is retrievable from surface if required
- Built-in release mechanism disconnects upper section if necessary
- High temperature components available
- Horizontal or vertical well applications
- Adaptable to various casing sizes
- Adaptable to various spacing requirements
- Variable length / flow area
